

Anjia Property

The same business, the same brand, the same properties — presented so a buyer abroad can actually act on them.

390px · iPhone 14 / 15

LIVE SITE — 89px scrolls off screen

PROPOSAL — fits the screen exactly

The homepage today (left) and the proposal (right) on an iPhone 14. The red line marks the edge of the screen — everything beyond it is off-screen until the visitor discovers they can drag the page sideways.

	Prepared for
Company	Anjia Property Management Co., Ltd.
Site	anjia-home.net
Prepared	4 September 2026
Basis	Measurement of the live site across 10 screen sizes, and a working redesign built from your own 67 listings and your own photography

Where things stand

Your desktop site is competent. The problem is that property buyers browse on phones, and on a phone the site does not fit the screen.

We measured the live site on ten devices, from a 320-pixel Android up to a 1920-pixel desktop. Below 480 pixels — which is most phones in use — the page is wider than the screen and slides sideways under the thumb. Prices and descriptions are cut off mid-sentence.

- **On the most common Android screen, 119 pixels of every section sit off-screen.** A third of your property card is not visible without the visitor discovering they can drag the page sideways.
- **There is no menu on a phone.** Below 768 pixels the header keeps only the logo — Thailand, About, Process, News, Contact and the Free Consultation button all disappear, and nothing replaces them. A visitor arriving from an advertisement cannot reach another page.
- **Three floating buttons sit on top of your text.** They cover prices and testimonials at every size.
- **Search engines see an empty page.** Your listings are not in the HTML, so none of them can be found organically. Every visitor has to be paid for.

None of this is anyone's fault. The site runs on a third-party platform, and these are the platform's decisions, not yours — which is also why they cannot be fixed from inside it.

What that costs, in plain terms

What happens	What it means for the business
A third of the page is off-screen on a phone	The buyer sees half a price and forms an impression of the firm from it
No menu, no call to action on mobile	Advertising spend lands on a page with no way forward
1.1 MB of code before the first picture	Several seconds of blank screen on a Thai mobile connection
Nothing readable by search engines	You rent traffic instead of earning it
The bare domain shows a security warning	The first impression is a browser warning naming another company
A competitor runs the identical website	Your differentiating sentence is on their homepage too, word for word

Before and after, on every screen

Both sites captured in the same browser, at the same emulated device size, minutes apart. Nothing is retouched. In each pair the live site is on the left and the proposal on the right; the red line marks the edge of the phone screen.

Phones

320px · Small Android / iPhone SE 1

LIVE SITE — 159px scrolls off screen

PROPOSAL — fits the screen exactly

LIVE SITE — no overflow

PROPOSAL — fits the screen exactly

iPad mini, portrait.

1024px · iPad Pro landscape

LIVE SITE — no overflow

PROPOSAL — fits the screen exactly

iPad Pro, landscape. From here up, the live site stops overflowing and the question becomes presentation rather than function.

1440px · Desktop

LIVE SITE — no overflow

PROPOSAL — fits the screen exactly

Desktop, 1440 pixels.

1920px · Desktop HD

LIVE SITE — no overflow

PROPOSAL — fits the screen exactly

Desktop HD, 1920 pixels.

What the redesign changes, measured

Both sites were measured the same way — geometry read out of the browser's own layout engine, not estimated from a picture.

	Live site	Proposal	Why it matters
Content off-screen at 320px	159 px	none	Half a phone-width of your page becomes visible
Content off-screen at 360px	119 px	none	The most common Android screen in the world
Content off-screen at 390px	89 px	none	iPhone 14 and 15
Menu items on a phone	0 of 6	all 6, in a drawer	A phone visitor can reach the rest of the site
Call to action on a phone	none	fixed bar, always present	The enquiry route survives the small screen
Operating-system dropdowns	9	0	Your brand stays on screen while a buyer chooses
Touch targets under 44 px	30 of 58	0	Nobody mis-taps a price
Colours in the stylesheet	383	67	A palette instead of ad-hoc values
Text sizes	25	9-step scale	Type that looks deliberate
Layout breakpoints	18 (incl. 720 and 721)	3	The page reflows as one design, not per component
Code before the first picture	1.08 MB	no framework at all	The page paints immediately
Listings readable by search engines	0	all 67	Organic enquiries become possible
Page titles	same on every page	one per property	Your listings become clickable in search results

What we kept, and what we changed

The brief was to raise the site to a luxury register without losing Anjia. So the brand did not move — the discipline around it did.

Kept

- **Your orange.** #ff9418 is unchanged and still the accent that carries the brand.
- **Your slate.** #0f172a still does the work on primary buttons and chrome.
- **Your content.** Every property, price, floor count, developer profile, nearby-amenity distance, testimonial and article on the new site came from your own database. Nothing was invented.
- **Your photography.** All 787 images were taken from your own library.
- **Your four languages.** The switcher stays; it simply no longer hands the screen to the phone's operating system when someone uses it.

Changed

- **The neutrals are now warm.** Every grey carries a little of the amber, so the page reads warm rather than clinical — closer to the coast the properties are actually on.
- **One display face with character** for headings and prices, and one interface family that covers Latin and Thai in a single font, so nothing needs a separate treatment.
- **Ownership leads, price follows.** Your own data records whether each unit sits inside a building's foreign quota. That is the first filter on the collection page — see overleaf.
- **A studio and a villa are no longer shown identically.** Three intentions — income, living, signature — separate a 0.99M studio from a 150M tower.

The collection page. 67 residences, and the first control is what a foreigner may lawfully own — not price.

One fix you can ship this week, without us

The sideways-scrolling problem has a single cause, and we found it. A News panel on the homepage refuses to shrink below its own content and drags the entire page to 479 pixels wide. Adding one line to the stylesheet releases it.

```
.insights__panel, .insights__articles, .insightArticle,  
.insightArticle__heading, .insightArticle article { min-width: 0 }
```

Screen	Page width before	Page width after	Result
320 px	479 px	320 px	Fits exactly
360 px	479 px	360 px	Fits exactly
390 px	479 px	390 px	Fits exactly

We tested this on your live site before writing it down. It is yours whether or not you take the redesign further.

One matter that needs attention before anything else

While measuring the site we found that your public interface returns, to anyone who asks and without any login: the **names of the owners of all 24 resale listings, mobile numbers for 23 of them, and LINE IDs for 7** — together with a named sales contact and direct mobile on 41 of your 43 developments.

None of this is shown on your website. It is returned by the interface behind it, which means it can be collected in bulk by anyone who looks. Given Thailand's Personal Data Protection Act this is worth raising with your platform provider today, ahead of any design work. We have not reproduced any of that data anywhere, and the redesign was built with those fields excluded at source.

A sensible order to do this in

Nothing here requires doing everything at once. The first stage costs almost nothing and removes the worst of the damage.

Stage	What happens	Effort	What you get
Now	The one-line width fix; certificate reissued to cover the bare domain; compression and caching switched on	Hours	The site stops scrolling sideways, stops showing a security warning, and loads roughly four times faster
Privacy	Owner contact details removed from the public interface	Platform provider	A data-protection exposure closed
Stage 1	Mobile menu, a permanent enquiry button, and the floating buttons moved off the text	1–2 weeks	Phone visitors can navigate and enquire — the traffic you already pay for starts converting
Stage 2	The design system: colour, type, spacing, one grid at three breakpoints	2–3 weeks	The site stops looking like a template and starts looking like Anjia
Stage 3	Ownership-led collection, real property pages, the foreigner-ownership guide	3–4 weeks	You compete on the thing the big portals cannot copy
Stage 4	Server-rendered pages, per-property titles, four-language markup	2–3 weeks	Listings appear in search; the advertising budget stops being the only source of visitors

What we would suggest

- Do the **Now** row this week regardless of what you decide about the rest. It is configuration, not design.
- Raise the **privacy** matter with your platform provider immediately, in writing.
- Treat **Stage 1** as the commercial priority. Every day it waits, advertising money lands on a page with no way forward on a phone.
- Stages 2 to 4 are the case for owning your own front end rather than renting a template that a competitor also runs.

The working redesign shown throughout this document is live and can be opened on your own phone. It contains all 67 of your properties, your photography, and your four languages. It is an unaffiliated proposal and is clearly marked as such on every page. All measurements were taken from the live site on 4 September 2026 and can be reproduced. Screenshots are unretouched.
